

Universal Harmonic Theory

Author: Simon Ellis

Working Draft v0.1

This document compiles the current working concepts of the Universal Harmonic Theory. It presents original hypotheses under development and is intended to be expanded over time.

Foundations

Universal Harmonic as the proposed fundamental structure. Time is treated as a derived measure of harmonic transition.

Fundamental Constants

$\kappa = 0.111111\dots$ ($1/9$) is proposed as the invariant harmonic constant. 0.115 is proposed as a separate dimensionless acoustic constant governing the acoustic manifestation of the C–G relationship.

Harmonic Components

H, C, G, D, S, ZNY and LFO form the symbolic framework under continued development.

C–G Interaction

The interaction between C and G is proposed to be infractional rather than fractional within this theoretical framework.

Particle Excitation

Particle excitation is proposed to require LFO modulation. Wave–particle duality is interpreted as an expression of harmonic coherence.

Acoustic Domain

The 3:2 relationship and the dimensionless constant 0.115 are proposed to characterize the pure acoustic harmony of C and G. The acoustic domain is treated separately from the primary harmonic equations.

Future Development

Dark matter, gravity, Higgs interactions, neutrinos, cosmology, mathematical derivations and experimental predictions remain to be expanded.
