

Universal Harmonic Theory

Volume I – Chapter 16

Harmonic Pulse-Width Modulation and Localised Gravitational Equilibrium

This chapter presents conceptual symbolic relationships proposed within Universal Harmonic Theory. The equations below are theoretical constructs intended to express relationships inside the framework; they are not established laws of physics.

16.1 Harmonic Equilibrium

Symbolic equilibrium equation:

$$H_{eq} = ZNY + \Phi_G \cdot M_{PWM}(C,G) \cdot \Psi_s$$

where H_{eq} is the harmonic equilibrium state; ZNY is the proposed equilibrium condition; Φ_G denotes the local gravitational influence; $M_{PWM}(C,G)$ is the proposed harmonic modulation operator; and Ψ_s is the scatter-field configuration.

16.2 Harmonic Modulation Operator

$$M_{PWM}(C,G) = \alpha \cdot \sin(\omega t) \cdot R_{(C:G)}$$

Here α is a symbolic modulation amplitude, ω an angular modulation parameter, t time used as a descriptive variable, and $R_{(C:G)}$ the proposed harmonic relationship represented by the C–G interval.

16.3 Localised Gravitational Coupling

$$\Phi_{eff} = \Phi_G \times M_{PWM}(C,G)$$

This symbolic relation proposes that the effective harmonic organisation depends on both the local gravitational environment and the harmonic modulation operator.

16.4 Scatter-Field Conservation

$$\Psi_{total} = \sum \Psi_i = \text{constant}$$

Within the hypothesis, particle identity is assumed to remain conserved while internal field organisation may be redistributed within a coherent scatter-field.

16.5 Restoration Toward Equilibrium

$$\lim(t \rightarrow \infty) H_{eq} \rightarrow ZNY$$

Conceptually, disturbed harmonic states are proposed to evolve toward the equilibrium condition ZNY .

Scientific Note

These equations are symbolic representations of the proposed conceptual framework. They are included to formalise the internal logic of the theory and are not derived from, nor validated by, established physical theory.
